Project: RBH Jigsaw Bournemouth Hospital
Client: Brymor
Tonnage: 180 tonnes
Location: Bournemouth

This prestigious project saw Snashall Steel carry out the fabrication and erection of one of the biggest construction projects at Bournemouth Hospital in recent years; A 2000m² new building to house oncology, haematology, gynaecology, breast care and early pregnancy, funded by the Jigsaw Appeal.

The 180T two story frame, with a plant room on top, was of a simple construction. The composite floors provided a diaphragm action, which enabled the majority of the connections to be designed in house by the design draughtsman on flexible end connections. Careful consideration however had to be considered throughout, to accommodate a future third floor extension.

With SSF now fully CE compliant, the main contractor could rest assured that all steel would be delivered to site to a high quality, to meet the new regulations. With multiple visits required for the erection of the steel frame, there was thorough coordination with other trades. This was to ensure a smooth completion of the frame, which was achieved with minimum disruptions to the satisfaction of the main contractor.
