## Education

**Project:** Rosewood School  
**Client:** Kier Construction  
**Tonnage:** 55 Tonnes  
**Location:** Southampton

This project involved the fabrication and erection of new classrooms for a specialist school in Southampton valued at £4m. The steel frame included a raised plant area which over looked a flat roof across the remainder of the frame with a linking canopy back to the existing buildings on campus.

The versatile frame contributed to the first phase of renovating the schools complex and facilities. The steelwork incorporated an extensive number of continuous ledger angles to support various trades such as masonry and concrete slab. Snashall Steel erected the concrete slabs which involved multiple site props for the steel enabling a fluent construction process.
