Residential

Residential

Project: Travelodge
Client: Soldi
Tonnage: 230 tonnes
Location: Farringdon

Travelodge Farringdon involved SSF completing the detailing, fabrication and erection of the new retail and hotel complex.

A main feature of the frame was 17m long Westok rafters which spanned over a ground floor retail unit. The frame itself consisted of a full steel frame at ground floor level with a partial second floor steel frame. The frame went full height around the lift shaft area.

SSF had to make allowance for concrete decking to be sat on top of their steel frame. After the steel frame was in place, the client had traditional build for couple of floors to finish the rest of the hotel complex.

The frame also consisted of cold rolled side rails and parapet details to support the clients cladding requirements which required close collaboration with the cladding supplier. There was a canopy to the front of the building around the entrance area which had thermal break requirements for cold bridging.

The erection was carried out competently and professionally and was completed within the clients target programme.
