Airports

Project: Bristol Airport
Client: ISG Pearce
Tonnage: 280 tonnage
Location: Bristol Airport

This project involved the construction of a new central pier for the expansion of Bristol International Airport. The large scale re-development comprised a new central pier, a new passenger walkway and substantial improvement to the existing terminal lobbies. The two storey steel frame has been designed to account for the latest commercial jet aircraft and for the surge of passengers during busy travel times by incorporating a large number of stairs and passenger lifts.

Extensive planning and organisation was required to erect the structure while the airport remained open and adhering to the strict security procedures.
